

PRODUCT

BBE® CLUNGENE | RAPID TEST
 COVID-19 Antigen Rapid Test Cassette

The advantages at a glance

- Listed by the German Federal Institute for Drugs and Medical Devices (BfArM)
- Performance independently confirmed and listed by the Paul Ehrlich Institute
- Easy to use and simple sample collection
- Fast and reliable results in maximum 15 minutes
- Naso- and oropharyngeal samples possible
- Sensitivity: 98.5%
- Specificity: 99.9%

THE TEST

A wide-ranging, nationwide testing strategy is a fundamental building block in combating the Corona pandemic. The Clungene Antigen Rapid Test provides a simple method for qualitative detection of SARS-CoV-2 antigens in suspected individuals. This test is particularly easy and flexible to be used.

The test cassettes, as well as all other utensils required for the performance of the test are hygienically packed and can be used separately. The individually packaged rods, buffer liquid and cassettes allow several tests to be performed from one box.

The results of the Clungene Antigen Rapid Test have been independently confirmed by the Paul Ehrlich Institute, among others. Currently, the test may only be performed by trained and instructed personnel.

Please follow the instructions enclosed in each box. Please inform yourself about all additional instructions, for example on storage or instructions of the (local) authorities, etc. for proper disposal. Treat each sample taken as if it were an infectious agent.

STANDARDS AND APPROVAL

CoVid-19 antigen rapid tests are listed in Germany by the Federal Institute for Drugs and Medical Devices. Such a listing is essential for the distribution of the products in Germany, but it only reflects the sensitivity and specificity values provided by the manufacturer.

Only the Paul Ehrlich Institute checks in objective studies whether a test meets the minimum requirements and consequently, following a successful study, issues a recommendation in the form of a listing of the test and publishes it as „Comparative Evaluation of the Sensitivity of SARS-CoV2 Antigen Rapid Tests“.

All tests offered by BBE Solutions® GmbH are listed therein, thus are independently evaluated and considered to be „according to the current state of the art“. In addition, this product has a Pharmacy Central Number (PZN) and is therefore also approved for the sale in pharmacies.

Box content: 25 pcs. per box, individually packed
PZN: 17209750

 COVID-19 Antigen Rapid Test Cassette

IMPORTANT FACTS

Enclosed manual in English language

Individually packaged cassettes and buffer solutions

Simple and intelligible diagnosis

STORAGE AND TRANSPORT

Please note that rapid antigen tests are very sensitive to temperatures and must be stored between 4°C to 30°C. This is a sensitive medical device from the field of invitro diagnostics. Improper storage or transport without appropriate precautions can strongly influence the evaluation and falsify the results.

BBE Solutions® stores all antigen rapid tests in a temperature-controlled warehouse, which guarantees constant temperatures between 10°C and 20°C. All data are digitally recorded with DAkKS calibrated sensors and stored in a forgery-proof manner. Our customers can view these data at any time.

The transport is carried out at a temperature of 15°C to 25°C by the courier service „Trans-O-Flex“. This service is specialized in the reliable delivery of sensitive medical products to doctors, hospitals and end customers. Delivery takes place on the next working day.
